

With that, the autumnal equinox has come to pass, and I think I've captured it almost as well as I could have. Below is an image I took on the 22nd, and I honestly timed it perfectly. I was standing in the exact same spot as in week 4, right on the stairs leading down to BU from Beacon St. I took the photo looking exactly due West, I even took out my phone's compass to make sure. The photo is a bit misleading though, since the highway/train track makes it look like the sun is not setting in a cardinal direction. Other than that though, I feel as if the experiment went well, and was overall very accurate. The picture I got of the setting sun was very clear with no obstructions, and I think it went very well. As for next year, there isn't much I would change. Maybe I would get to the spot 10-15 minutes earlier so I could have a variety of photos, but that's about it. The location and execution were both good this time, so there's no need to change anything.
